

THE WORLD IN NUMBERS

A Data Visualization of 142 countries, 1952 to 2007

my second internship project!

Task 3 of 3

THE STORY I WANTED TO TELL

Can money buy a longer life? And how did the world change in just 55 years? I used charts to answer four questions:

1. How did life expectancy change from 1952 to 2007?
2. Does higher income mean a longer life?
3. Which continents lead and which lag?
4. How did population grow across continents?

142

countries

1,704

records

5

continents

THE GAPMINDER DATASET

COUNTRY

Name of the country

CONTINENT

*Asia, Europe, Africa, Americas,
Oceania*

YEAR

Every 5 years, 1952 to 2007

LIFEEXP

Average life expectancy (years)

POP

Total population

GDPPERCAP

Income per person (GDP)

Data quality check: no missing values in any column.

CHAPTER III

RIGHT CHART, RIGHT QUESTION

LINE

Change over time

Life expectancy 1952-2007

SCATTER

Relationship of two things

Income vs life expectancy

BAR

Compare categories

Continents, richest countries

BOX PLOT

Spread inside groups

Differences within continents

HEATMAP

Correlation matrix

a good chart answers one question

CHART ONE · TREND

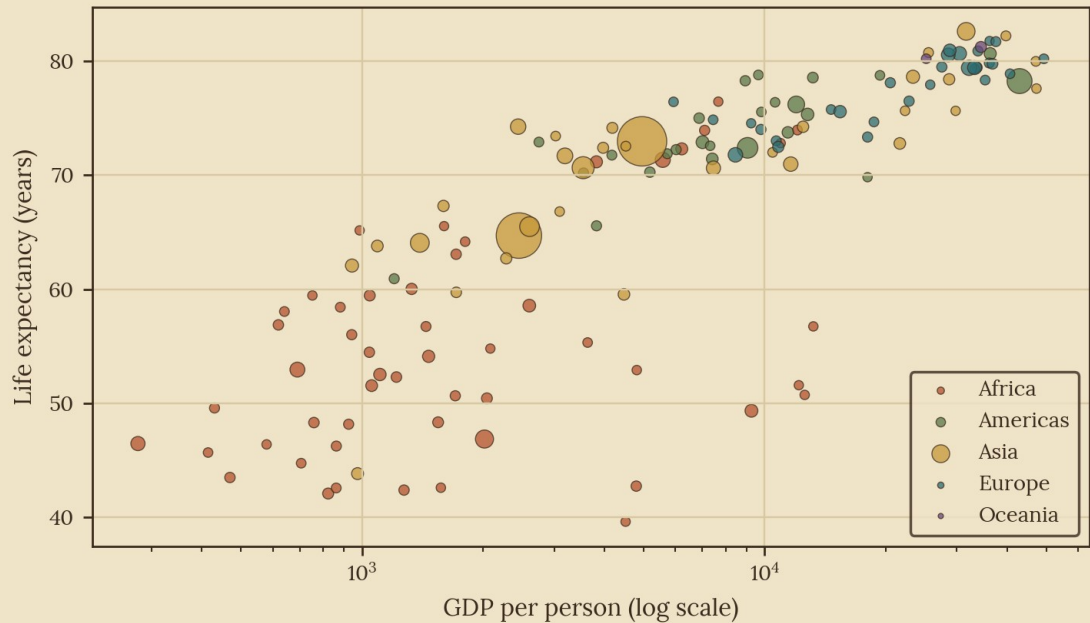

THE WORLD IS LIVING LONGER

INSIGHT Average life expectancy rose from about 49 years in 1952 to about 67 years in 2007, a gain of roughly 18 years in 55 years.

CHART TWO · RELATIONSHIP

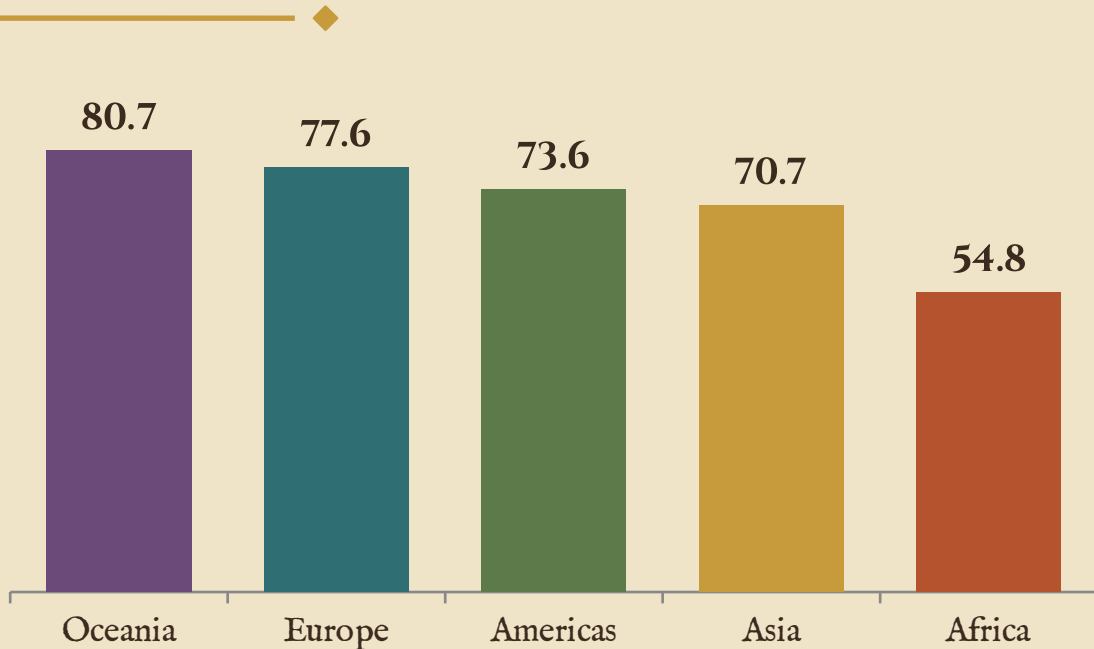

DOES INCOME BUY YEARS?

INSIGHT Richer countries tend to live longer. The curve is steep at low incomes and flattens at high incomes. Bubble size shows population.

CHART THREE · COMPARISON

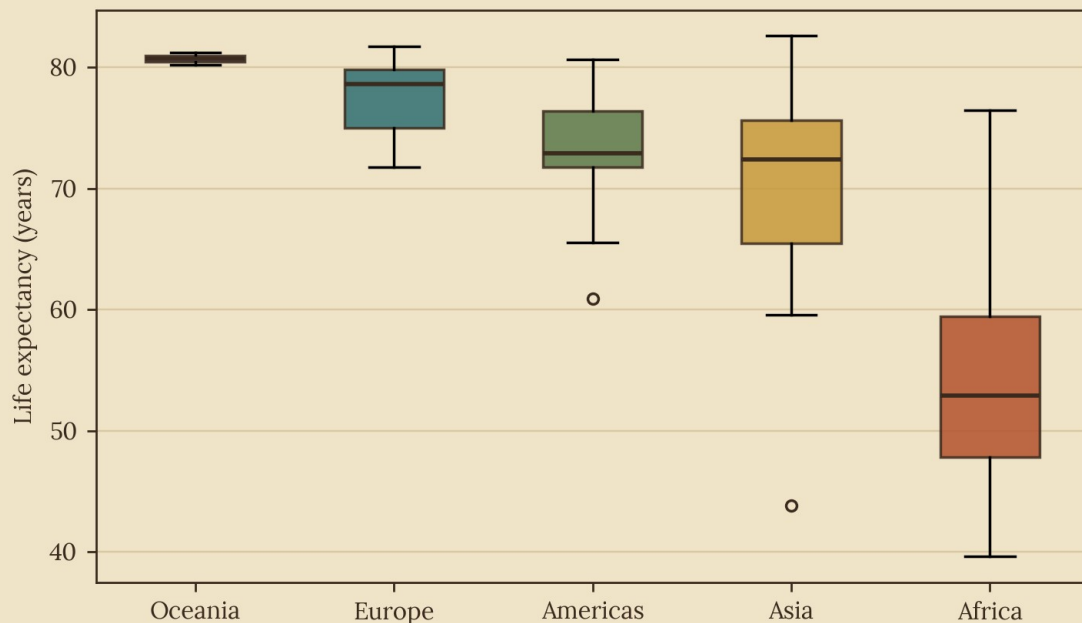

LIFE EXPECTANCY BY CONTINENT

INSIGHT In 2007 Oceania (about 81 years) and Europe (about 78) lead. Africa (about 55) is lowest, a gap of over 25 years.

CHART FOUR · SPREAD

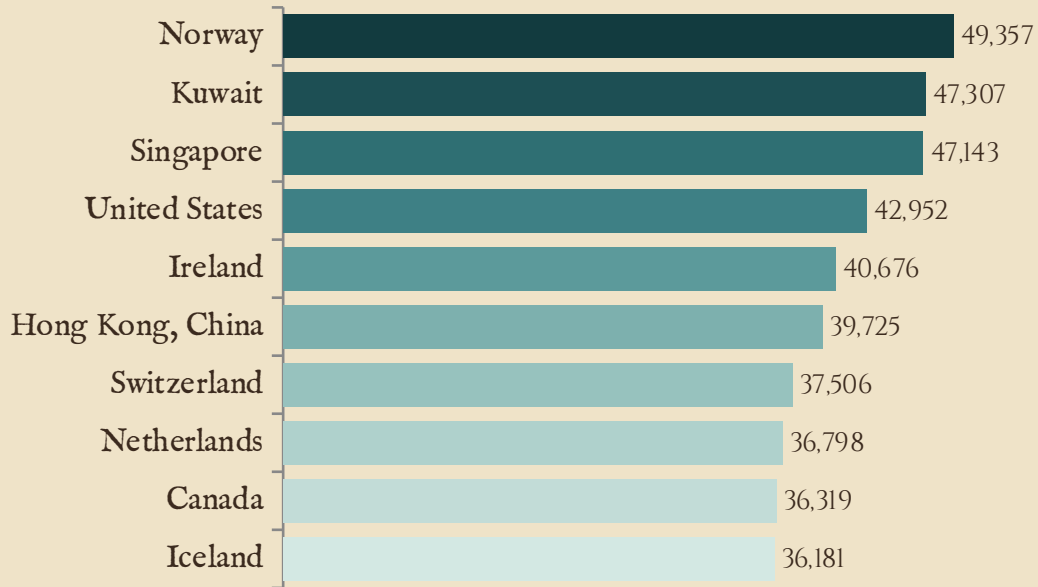

DIFFERENCES INSIDE CONTINENTS

INSIGHT Oceania and Europe are tightly grouped. Africa has the lowest median (about 53) and a wide spread, while Asia ranges from Afghanistan (44) to Japan (83).

CHART FIVE · RANKING

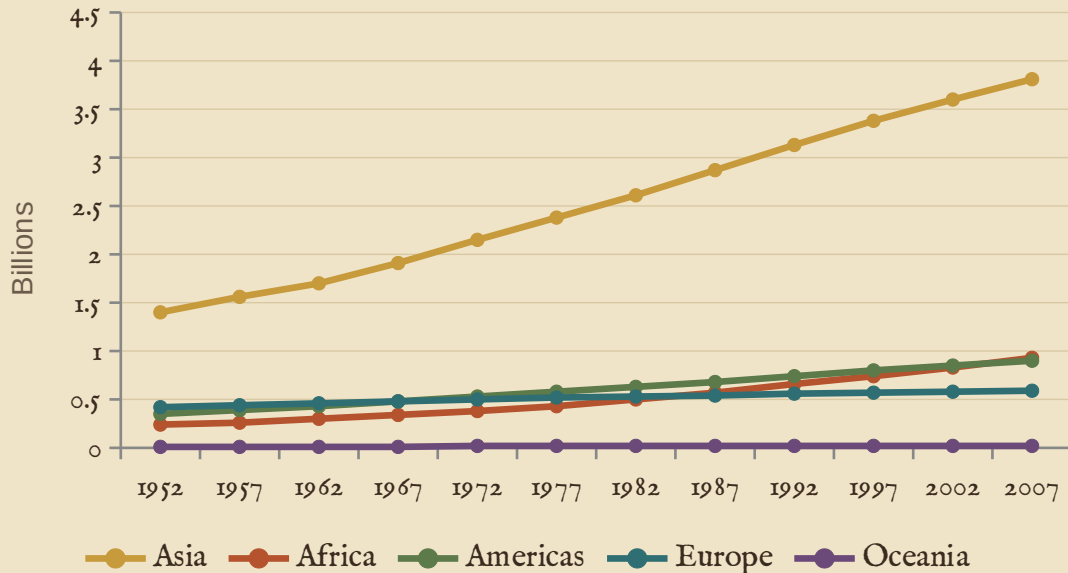

THE 10 RICHEST COUNTRIES

INSIGHT Norway, Kuwait and Singapore lead, each above 47,000. The top 10 mixes oil-rich nations with advanced economies.

CHART SIX · GROWTH

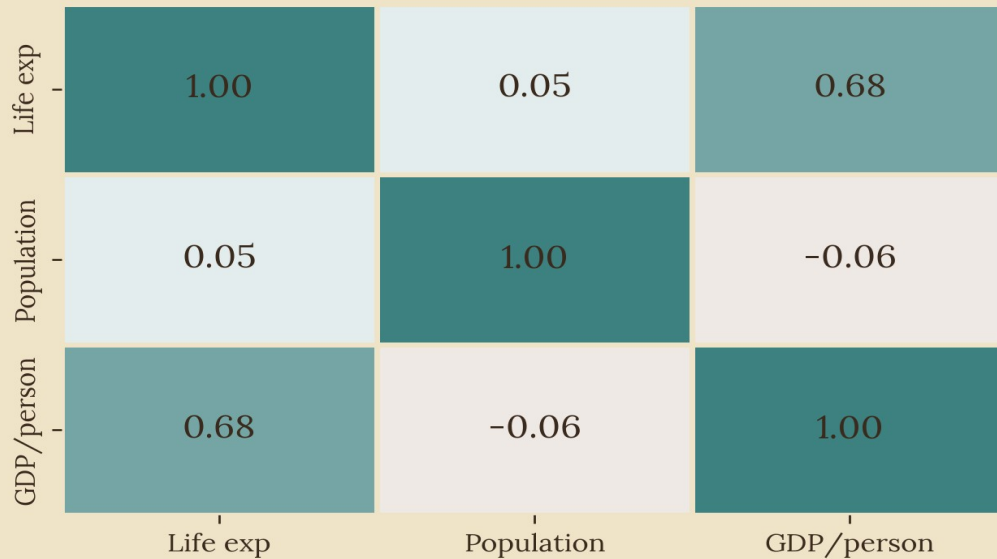

WHERE THE PEOPLE GREW

INSIGHT Asia grew the most, from 1.4 to 3.8 billion. Africa grew fastest in percentage (0.24 to 0.93 billion). Europe grew slowly.

CHART SEVEN · CORRELATION

WHAT MOVES TOGETHER?

INSIGHT GDP per person and life expectancy are strongly linked (0.68). Population has almost no link with either one.

CONCLUSION

WHAT THE CHARTS TOLD ME

- 1 **THE WORLD GOT HEALTHIER:** life expectancy rose about 18 years.
- 2 **INCOME MATTERS,** but its benefit levels off at high incomes.
- 3 **AFRICA STILL TRAILS** by over 25 years, with big gaps inside.
- 4 **ASIA DROVE GROWTH,** adding about 2.4 billion people.
